INTRODUCTION

In today's educational environment, teachers continuously seek innovative teaching strategies that can enhance students' learning experiences and encourage active participation. One of these strategies is Game-Based Learning (GBL), an approach that integrates game elements into the teaching and learning process. By combining educational objectives with enjoyable and interactive activities, Game-Based Learning creates a more engaging learning environment that can motivate students to participate actively in class.

In Physical Education, student engagement and physical fitness are essential components of successful learning. However, maintaining students' interest and participation in physical activities can be challenging, especially when traditional teaching methods are used. Game-Based Learning offers an alternative approach by transforming physical activities into enjoyable and meaningful experiences, encouraging students to become more involved while developing their physical abilities.

Physical fitness plays a vital role in the overall well-being of students, as it contributes to their health, academic performance, and quality of life. At the same time, student engagement is an important factor that influences learning outcomes, motivation, and participation. When students are actively engaged in learning activities, they are more likely to develop positive attitudes toward education and physical activity.

This study, entitled **"The Effects of Game-Based Learning on the Physical Fitness and Engagement of Students in Daehan College,"** aims to examine how the use of Game-Based Learning influences students' physical fitness and level of

engagement. The findings of this study may provide valuable insights for educators, school administrators, and future researchers in developing effective teaching strategies that promote both active learning and physical development among students.

STATEMENT OF THE PROBLEM

1. What is the demographic profile of the respondents in terms of:

- Age
- Sex
- Year Level

2. What is the level of students' physical fitness before the implementation of Game-Based Learning?

3. What is the level of students' physical fitness after the implementation of Game-Based Learning?

4. What is the level of student engagement during Game-Based Learning activities?

5. Is there a significant effect of Game-Based Learning on the physical fitness and engagement of students?

LEGAL BASIS

1. Republic Act No. 10533

Enhanced Basic Education Act of 2013

This law promotes the use of learner-centered, innovative, and interactive teaching approaches to improve students' learning outcomes. Game-Based Learning aligns with this mandate by encouraging active participation and meaningful learning experiences.

2. Republic Act No. 5708

Schools Physical Education and Sports Development Act of 1969

This Act emphasizes the importance of Physical Education in promoting students' physical fitness, health, and holistic development. The use of Game-Based Learning supports this objective by increasing students' involvement in physical activities.

3. Department of Education (DepEd) Order No. 21, s. 2019

Policy Guidelines on the K to 12 Basic Education Program

This policy encourages the use of innovative teaching strategies that enhance student engagement and improve learning outcomes. Game-Based Learning serves as an effective instructional approach that promotes active participation and motivation among learners.

HYPOTHESIS

Null Hypothesis (H_0)

There is no significant effect of Game-Based Learning on the physical fitness and engagement of students in Daehan College.

Alternative Hypothesis (H_1)

There is a significant effect of Game-Based Learning on the physical fitness and engagement of students in Daehan College.

IMPLICATIONS

The results of this study may provide evidence regarding the effectiveness of Game-Based Learning as an instructional strategy in Physical Education. If found effective, the integration of game-based activities may contribute to improved physical fitness and higher levels of student engagement among learners in Daehan College.

Furthermore, the findings may encourage educators to adopt more innovative and learner-centered teaching approaches that promote active participation and motivation. The study may also serve as a basis for the development of Physical Education programs that incorporate game-based activities to enhance students' learning experiences and physical development.

For school administrators, the results may support the implementation of policies and programs that encourage the use of interactive teaching strategies. In addition, the findings may contribute to the existing body of knowledge on Game-Based Learning and

provide valuable references for future researchers conducting similar studies in the field of education and physical fitness.

The findings of this study may indicate that Game-Based Learning is an effective instructional approach for improving students' physical fitness, engagement, and motivation in Physical Education classes. By incorporating game-based activities, students may become more active participants in the learning process, leading to enhanced physical performance and a more positive attitude toward physical activities. The results may also encourage teachers to adopt innovative and learner-centered teaching strategies, support the integration of Game-Based Learning into the Physical Education curriculum, and provide valuable information for school administrators in developing programs that promote active learning. Furthermore, the study may serve as a useful reference for future researchers who wish to explore the relationship between Game-Based Learning, student engagement, and physical fitness.

SIGNIFICANCE & IMPORTANCE OF THE STUDY

This study is significant because it seeks to determine the effects of Game-Based Learning on the physical fitness and engagement of students in Daehan College. As educational institutions continue to explore innovative teaching strategies, the findings of this research may provide valuable insights into how game-based activities can enhance students' participation, motivation, and overall learning experience in Physical Education classes.

For students, the study may contribute to a better understanding of how Game-Based Learning can improve their physical fitness and encourage active participation in

classroom activities. Through engaging and enjoyable learning experiences, students may develop a greater interest in physical activities and adopt healthier lifestyles.

For teachers, the findings may serve as a basis for improving instructional practices by integrating game-based strategies into Physical Education lessons. The study may help educators identify effective approaches that increase student engagement, motivation, and learning outcomes.

For school administrators, the results may provide useful information for developing and implementing programs that promote innovative and learner-centered teaching methods. The findings may also support decision-making regarding curriculum enhancement and the adoption of strategies that foster students' physical and educational development.

For parents and guardians, this study may increase awareness of the importance of interactive and engaging learning approaches in supporting students' physical well-being, academic growth, and overall development. Understanding the benefits of Game-Based Learning may encourage greater support for educational activities that promote active participation.

Finally, for future researchers, this study may serve as a valuable reference for further investigations related to Game-Based Learning, student engagement, and physical fitness. The findings may contribute to the existing body of knowledge and provide a foundation for future studies in the field of education.
